

## Stock de sécurité

### Protocole :

- 1/ Définir le taux de service souhaité pour la référence article considérée
- 2/ S'assurer que la distribution des ventes est "normale" (suit une courbe de Gauss)
- 3/ Rechercher la valeur de K selon le taux de service souhaité dans la table de Gauss
- 4/ Calculer l'écart-type des ventes (historique ou prévision de vente) de l'article considéré
- 5/ En déduire le stock de sécurité et l'appliquer avec précaution en fonction de la variabilité des ventes et des aléas fournisseur

$$\text{Stock de sécurité} = K \times \sigma$$

	P1	P2	P3	P4	P5	P6	P7
Historique de vente	100	120	130	70	90	105	112
Ecart-type ( $\sigma$ )	20						
Taux de service souhaité	95%	96%	97%	98%	98,5%	99,0%	99,5%
Valeur K correspondante	1,65	1,75	1,88	2,06	2,17	2,33	2,58
<b>Stock de sécurité</b>	<b>33</b>	<b>35</b>	<b>37</b>	<b>41</b>	<b>43</b>	<b>46</b>	<b>51</b>
